Staplers

Proposal:

For our application, we would like to create a web-based store page. The store page will be a place for users to post their new or used school supplies, textbooks, or other dorm items so that other students who may need them may purchase them. It will allow users to browse and purchase items that they are looking for. Users will be able to actively browse the store by categorizing by tags such as price, intended use, or any other specifications that may be related to the product they are looking for. Additionally, there will be a search bar for users to type in names of specific items to find. When a user finds an item that they like but might not want or be able to purchase immediately, there will be a wish list to keep track of all of the items they have seen and want to come back to later. This wish list will also have features to specifically search within for users who may have longer wish lists to find what they need. Users can also save their personal information such as address or credit card numbers in order to make transactions easier in the future. As for how items get on the store in the first place, users are able to make listings themselves in order to sell any unwanted items that they may have or want to get rid of. These items will require a price and some tags to go along with them in order for other users to find them easily. Users that have made transactions with sellers will be able to rate the sellers on a 5 star scale and write a review in order to let other users know whether the seller is trustworthy or not. Finally, any sellers will have their own store page on the website so that other users can click on their username and see what else they have for sale and also view the seller's star rating.
