

Non-leaf functions

- Steps

- Before doing any work with registers
 - Save $\$ra$ on the stack
 - If you will use any $\$sX$ registers, save their old values on the stack, since the caller will need them after returning
 - If you will need the values of any $\$aX$ registers after a function call, store them on the stack
- Do your work
- Before returning
 - Restore $\$ra$ and $\$sX$ registers from the stack

Recursion

- When a function calls itself
- Factorial

$$n! = \frac{1 \times 2 \times 3 \times \dots \times (n-1) \times n}{\uparrow}$$

$(n-1)!$

$$n! = n \times (n-1)!$$

$$0! = 1$$

```
int factorial(int n) {
```

```
    if (n == 0)
```

```
        return 1;
```

```
    return n * factorial(n-1);
```

```
}
```

```

#include <stdio.h>

int function_one(int x, int y);
int function_two(int x, int y, int z);

int main() {
    printf("Enter x: ");
    int x;
    scanf("%i", &x);

    printf("Enter y: ");
    int y;
    scanf("%i", &y);

    int z = function_one(x, y);

    printf("z: %i\n", z);

    return 0;
}

```

```

int function_two(int x, int y, int z) {
    return (x + y) * z;
}

```

Handwritten annotations for function_two:
 - Above x: \$a0
 - Above y: \$a1
 - Above z: \$a2
 - Below (x + y): \$t0
 - Below the return statement: \$t0 -> \$v0

```

int function_one(int x, int y) {
    int z = x * y;
    int a = function_two(x, y, z);
    return a + z;
}

```

Handwritten annotations for function_one:
 - Above x: \$a0
 - Above y: \$a1
 - Above z: \$a2
 - Below z = x * y: \$s0
 - Below a = function_two(x, y, z): \$v0
 - Below a + z: \$v0
 - Below return: \$v0

Must save \$ra and
\$s0 on the stack
